I have thousands of images that I want to classify into different classes, such as heart, lung, pancreas, etc. I am new to the python software so I wanted to ask if I can use this package to do this task. A: With PyTrellis: you can train a classifier, then export the trained classifier as a JSON file that can be imported into a second machine. you can then load this JSON file into an Interactive

Python Shell (IPython) in the second machine, and use the trained classifier to make predictions for any new image. For more details: [Read the PyTrellis documentation](#) [Try the PyTrellis tutorial](#). The data that you import can be a numpy array or any other format, or even as an image file.
